Hydrophilic Interaction Chromatography

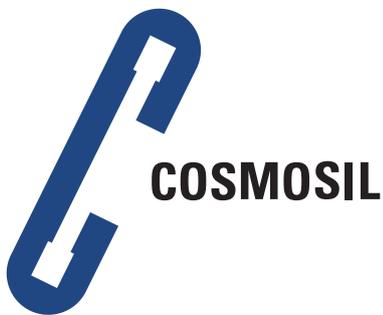

The hydrophilic interaction chromatography is a variation of normal phase chromatography. The elution order is similar to that of normal phase and the sample elution is in the order of increasing hydrophilicity.

Comparison with C₁₈

COSMOSIL HILIC can separate glycine and glycyglycine without ion-pair reagent. Although C₁₈ column can separate them with ion-pair reagents, there are some disadvantages such as longer column equilibration time, time-consuming preparation of mobile phase and earlier column deterioration.

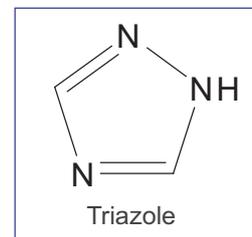

HPLC Column for Hydrophilic Interaction

COSMOSIL HILIC

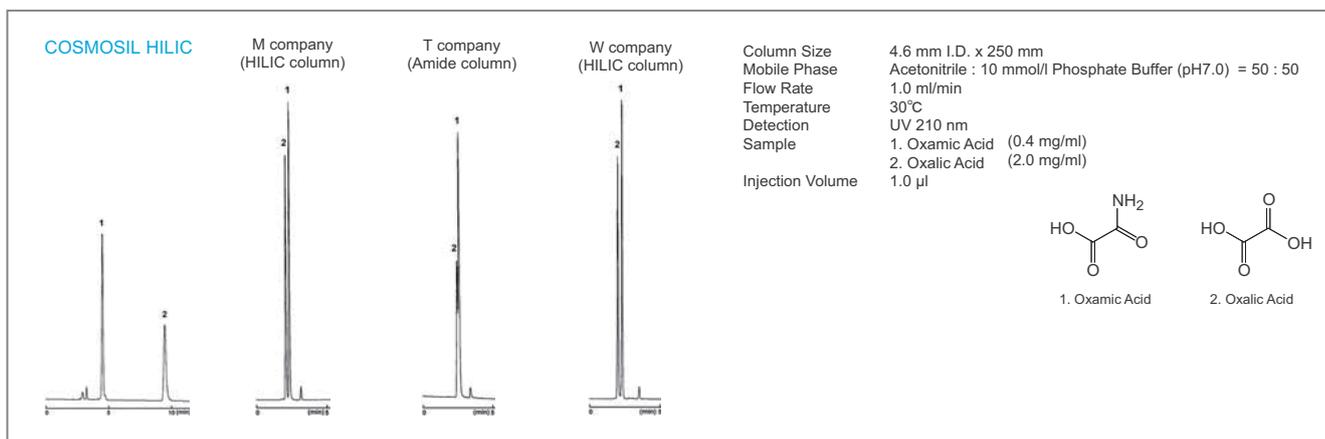

- Triazole bonded stationary phase
- Enhanced hydrophilic interaction
- Alternative selectivity to other HILIC columns

Different Interactions

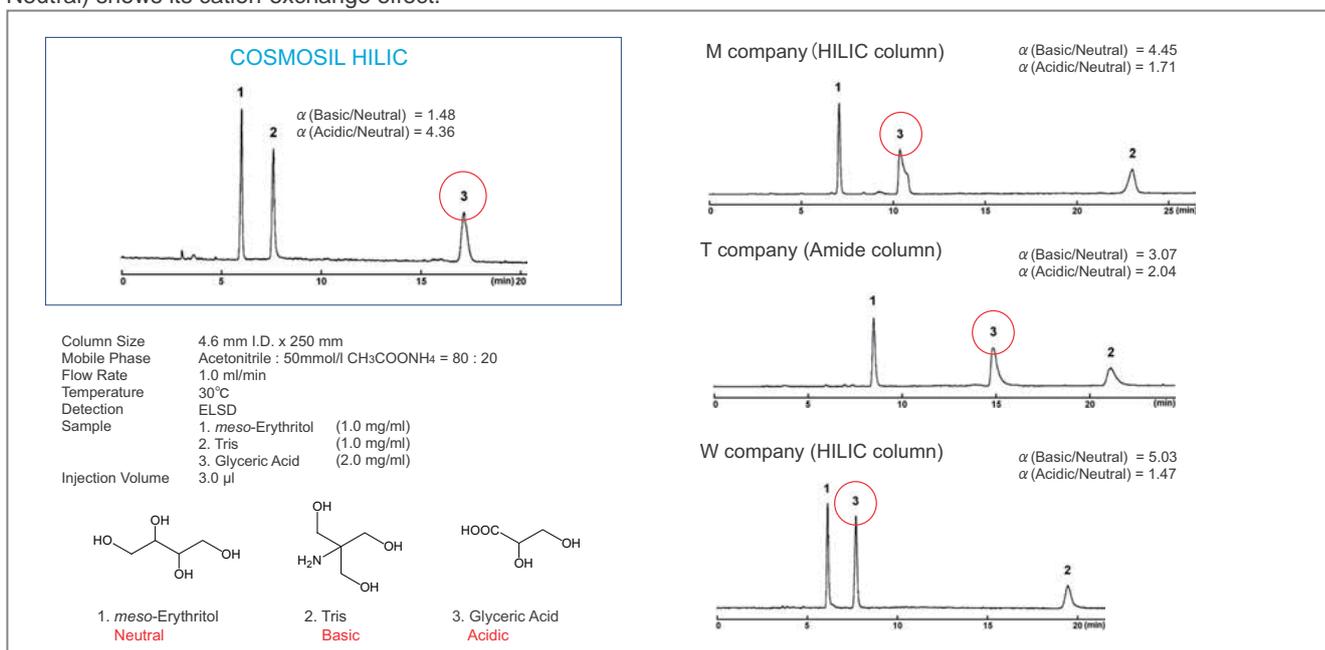

Separation of Anionic Compounds

Anionic compounds were used to evaluate the anion-exchange capability. The only COSMOSIL HILIC showed strong selectivity of anionic compounds against competitors' columns

Separation of Acidic, Basic and Neutral Compounds

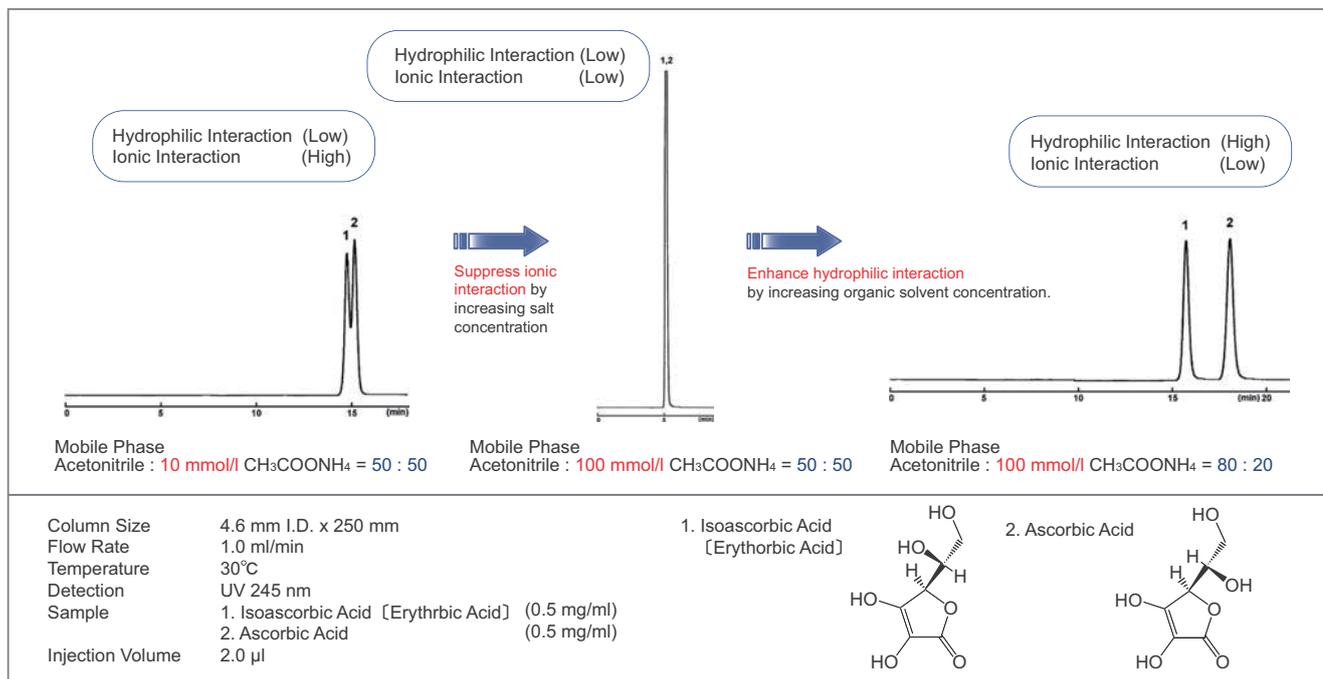

Acidic (Glyceric Acid), basic (Tris) and neutral (*meso*-Erythritol) compounds were used for evaluation of anion and cation-exchange characteristics. The separation factor $\alpha(\text{Acid/Neutral})$ indicates its anion-exchange capability and the factor $\alpha(\text{Basic/Neutral})$ shows its cation-exchange effect.

Different Interactions

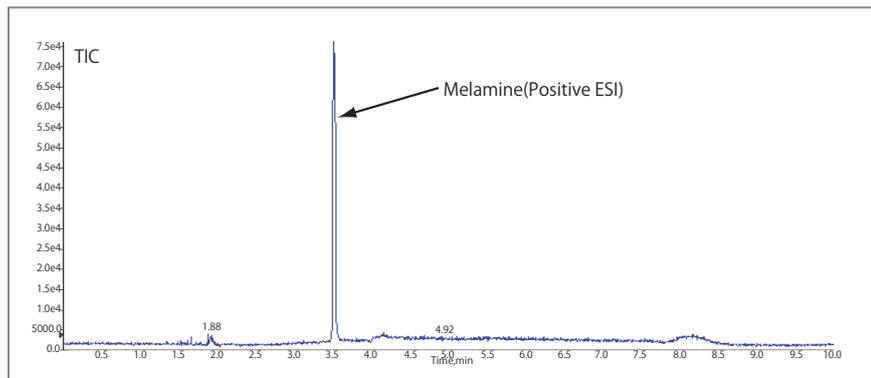

Separation by Hydrophilic Interaction

The retention mechanism of COSMOSIL HILIC is the combination of hydrophilic interaction and anion-exchange capability, and the retention can be controlled by changing the mobile phase.

Selection guide of mobile phase

COMOSIL HILIC column generates retention and separation by hydrophilic interaction (mainly hydrogen bond) and anion-exchange. Refer to following recommendations to select an appropriate mobile phase condition.

(1) The effect of organic solvent type and content

- In general, acetonitrile/water is used as mobile phase.
- Retention increases as water content in the mobile phase decreased. (Fig.1)
- Use acetonitrile content in the mobile phase within the range of 0-95% (in general 50-95%).
- Methanol/water generates shorter retention than acetonitrile/water. (Fig.2)
- Use only HPLC grade solvent

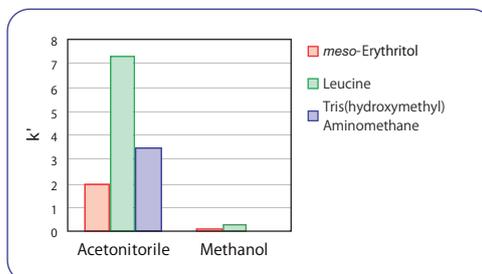

Fig.2 Difference of acetonitrile and methanol on retention

Column; COSMOSIL HILIC
Mobile phase; Organic solvent/ 10mmol/l CH₃COONH₄ = 90/10

(2) The effect of buffer pH

- Keep pH of the mobile phase within the range of 2-7.5.
- The buffer around neutrality generates larger retention. (Fig.3)

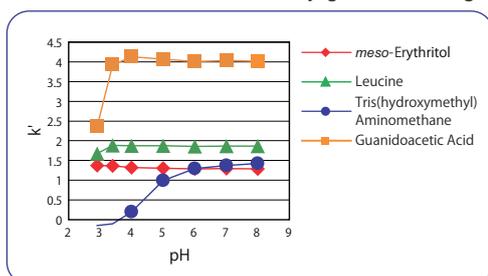

Fig.3 The effect of buffer pH on retention

Column; COSMOSIL HILIC
Mobile phase; Acetonitrile / 10mmol/l buffer = 90/10

(3) The effect of salt type and concentration

- When analyze ionic compounds, add salts or buffers in the mobile phase.
- When mobile phase has high acetonitrile content, note dissolubility of the salt. The dissolubility of phosphate buffers used widely in reversed phase chromatography is low in acetonitrile. Therefore use of phosphate buffers is not recommended. Keep the concentration of acetonitrile under 70% if use a phosphate buffer. Check that the salt does not precipitate when mixed with acetonitril before use.
- Ammonium acetate or formic acid ammonium buffers are recommended because they are soluble in high acetonitrile content.
- Use the buffer concentration within the range of 5 - 100mmol/l. Moreover, check that the salt does not precipitate after mixing buffer and acetonitrile.
- High salt concentration inhibits ion exchange capability and decreases retention. (Fig.4)
- Run mobile phase through membrane filter (less than 0.45μm in pore size) before use.

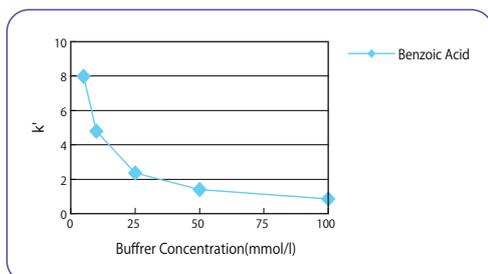

Fig.4 The effect of salt concentration on retention

Column; COSMOSIL HILIC
Mobile phase; Acetonitrile / 10mmol/l CH₃COONH₄ = 50/50

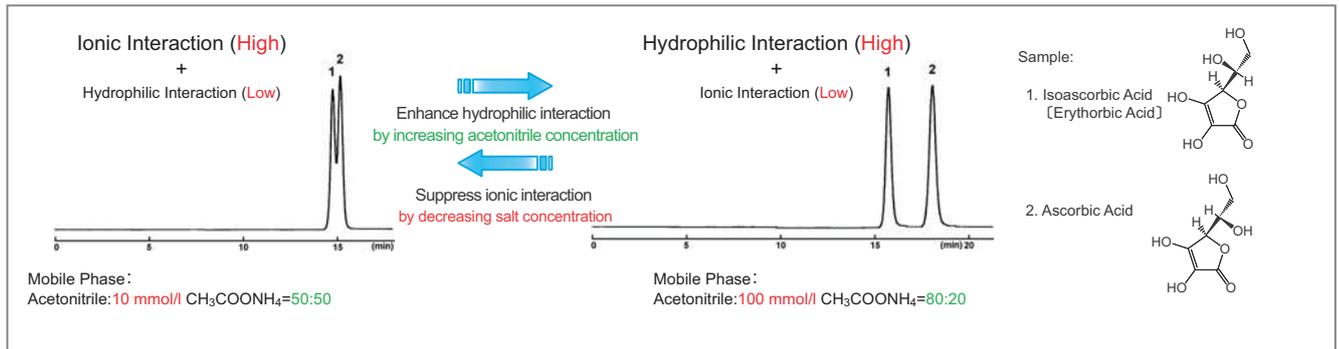

(4) Selection of mobile phase

Following are the recommended mobile phases for different compound types.

| | |
|----------------------|--|
| Neutral compounds | → Acetonitrile / Water = 90/10 |
| Basic compounds | → Acetonitrile / 10mmol/l CH ₃ COONH ₄ = 90/10 |
| Amphoteric compounds | → Acetonitrile / 10mmol/l CH ₃ COONH ₄ = 70/30 |
| Acidic compounds | → Acetonitrile / 10mmol/l CH ₃ COONH ₄ = 50/50 |
| | ↓ not eluted |
| | Acetonitrile / 10mmol/l Phosphate buffer (pH7.0)= 50/50 |

(5) Two interactions (hydrophilic interaction and anion exchange capability)

The retention mechanism of COSMOSIL HILIC is the combination of hydrophilic interaction and anion-exchange, and the retention can be controlled by changing the mobile phase. More specifically, the hydrophilic interaction can be enhanced by increasing the organic solvent concentration while suppressing the ionic interaction with high salt concentration.

(6) Improvement of peak shape

Try following if peak shape is tailing. The peak shape might improve.

- Add 5mmol/l EDTA to mobile phase.
- Change to citrate buffer. (i. e. 10 mmol/l citrate buffer pH7.0)

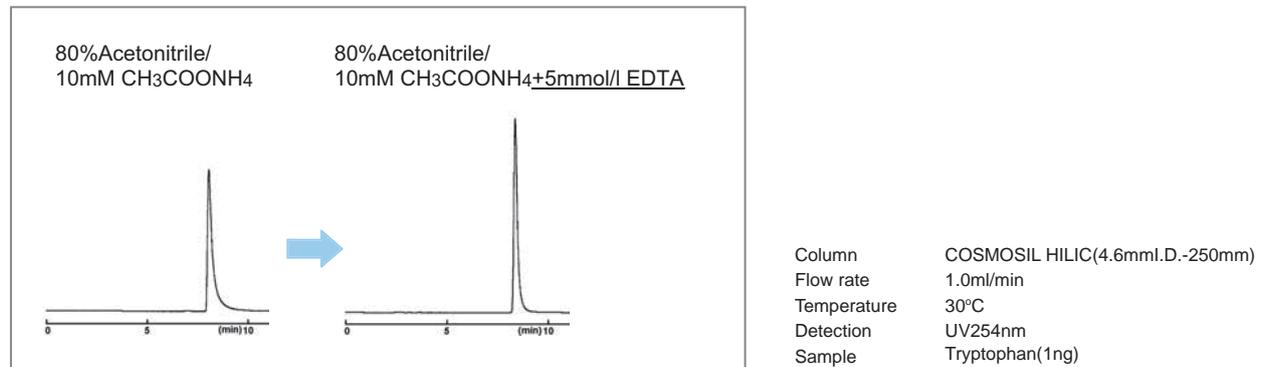

Fig.5 Improvement of peak shape

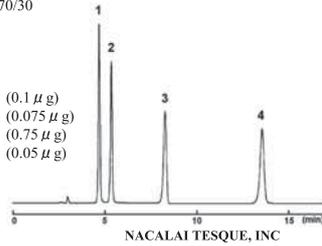

(7) Others

- Use scrupulously degassed mobile phase. Air bubbles generate detection noise and accelerate column deterioration.
- We recommend keeping the chromatography conditions constant, since frequent changes of mobile phase shorten column life.
